

Security

In today's world it is essential that data and facilities are secure to protect client information, ensure job integrity and provide a safe environment for employees and visitors. Each of our locations employs state-of-the-art security procedures to meet these requirements.

Data Security

Our data processing facilities are located in secure areas at each location. Data is accessed through local and remote terminals via an elaborate password security system. Depending on the nature of the data, terminals will be logged off if left unattended for a specific period of time to ensure only authorized personnel view the data.

- Modern network security system
- Data backup & virus protection
- Internet security
- Firewall security

Facility Security

Each facility is treated as a secure environment, with authorized access only and password access to restricted areas on our premises.

- Controlled visitor access
- Magnetic card access for all employee entrances
- Employee access to secured areas including network room and production control limited to "need to know" basis
- 24/7 alarm system with central station monitoring
- Sprinkler system
- Redundant material warehousing
- Video security
- On-site U.S.P.S. facility protection
